

Power Apps is five products in one

About \$250K a year today. Leaving means owning all five.

POWER APPS	IN THIS CONSOLE	IN THE DEMO
App builder	Each app is a tool on one shared shell	Part 3
Dataverse	Tables per app, role checks, masked personal data	Throughout
Connectors	Server-side code that calls the outside service	Part 2
Power Automate	Rules and approvals on one governed write path	Part 1
Admin plane	Roles, live settings, one audit log	Part 1

Your team asks, Devin builds, an engineer approves

A third way to change rules on money: fast, and reviewed.

Three times today, each change bigger than the last

 Human gate  Devin  Live

You still pay engineers: to review, not to trace

	POWER APPS TODAY	ENGINEERS ONLY	WITH DEVIN
New rule	~30 minutes, unreviewed	1–2 weeks	Same day, reviewed
Stop a misfire	Another live edit	A hotfix	One setting, in seconds
Remove it later	Nobody owns it	When a ticket gets prioritised	A reviewed pull request
Next app	More licences	Weeks	A first pull request, controls inherited

The first two columns are estimates. The last is what the demo showed, on seeded data with one reviewer.

Build, one app at a time, if you'll own the engine

WHAT THE DEMO SHOWS

Rules added, switched off and removed,
each one reviewed

A manual check replaced by a lookup

A new app that inherits the same controls

WHAT IT DOESN'T

Sign-on, hosting, backups and on-call

Business users building without an engineer

Production data and load

WHERE IT COULD GO WRONG

Formulas nobody wrote down, applied to
money

Reviews that turn into rubber stamps

Savings absorbed by engineers and hosting

NEXT 90 DAYS

1. Name an engine owner and a second reviewer
2. Move Chargebacks; run it beside the Power App
3. Go or stop on parity, review time and cost per change

WHERE DEVIN FITS

If you build: writes each change; engineers approve and merge

If you stay: custom connectors, tests and docs for flows
