

Devin lets ops change their own rules, with every change reviewed

Ops ask in the console, Devin writes and tests the change, and an engineer merges it on GitHub.

What this demo covers

- 1 · A rule

A refund hold for Kestrel
- 2 · Off and out

Switch it off, then remove it
- 3 · A daily check

Companies House monitoring

A person Devin Live

Leaving Power Apps means replacing five products, not one

You pay about \$250K a year for it today. Here's what replaces each part, and where the demo shows it.

POWER APPS	WHAT REPLACES IT	SHOWN IN
App builder	Each app is a page in the console, written by Devin	What Devin built
Dataverse	One database for every app, with access set by role	Throughout
Connectors	Code that talks to outside systems directly	Merchant monitoring
Power Automate	Rules and daily jobs, in code an engineer reviews	Refund hold
Admin plane	Roles, switches you flip live, and a full audit log	Switching rules on and off

Build it yourselves, one app at a time, with one engineer in charge

HIDDEN LOGIC

Formulas and flows nobody wrote down

Devin reads each app's export and lists every formula and flow step, done or to do

A PLATFORM TO OWN

Login, hosting, backups and monitoring that Power Apps gave you

Build them once, on the engine every app shares

REVIEW LOAD AND SPRAWL

Every change needs an engineer, and cheap changes invite more of them

One owner who can say no. Rules ship off, and come out when they stop earning their place

WHY BUILD

- Internal tools become part of the product: same engine, same review, same owner
- The ten new apps reuse the roles, rules and audit log the first three already have

WHERE DEVIN FITS

If you build: Devin writes the changes. Your engineers review and merge them.

If you stay on Power Apps: Devin can still build custom connectors and write tests and documentation.

A 90-day pilot on your own data will settle the decision

Refunds and KYC on your real merchants and cases, run alongside Power Apps before anything switches over.
