

Your team asks, Devin builds, an engineer approves

Changes go live the same day, and an engineer still checks every one.

What this demo covers

- 1 · A rule
A refund hold for Kestrel
- 2 · Off and out
Switch it off, then remove it
- 3 · A daily check
Companies House monitoring

 A person Devin Live

Power Apps is five products in one

It costs about \$250K a year. If you leave, you have to replace all five.

POWER APPS	WHAT REPLACES IT	SHOWN IN
App builder	Each app is a page in the console, written by Devin	What Devin built
Dataverse	One database for every app, with access set by role	Throughout
Connectors	Code that talks to outside systems directly	Merchant monitoring
Power Automate	Rules and daily jobs, in code an engineer reviews	Refund hold
Admin plane	Roles, switches you flip live, and a full audit log	Switching rules on and off

WHAT IT COSTS

You don't pocket the \$250K. You swap it.

WHAT REPLACES THE LICENCE

- Devin usage
- Engineer time to review and own it
- Hosting, login and backups
- Ongoing maintenance

YEAR ONE COSTS MORE

- Year 1:** about \$300K to build the platform and move three apps, against \$250K
- After that:** about \$150K a year to run, against \$250K
- About \$50K more up front, then about \$100K a year less

WHAT OWNING IT BUYS

- Your own integrations, data model and workflows
- For example, a Tier-2 KYC approval that checks your fraud model and transaction history, and needs a second reviewer above a threshold

Illustrative figures. The pilot replaces them with yours. Also check whether your Power Apps licences grow with each of the ten new apps.

Build it yourselves, one app at a time, with one engineer in charge

HIDDEN LOGIC

Formulas and flows nobody wrote down

Devin reads each app's export and lists every formula and flow step, done or to do

A PLATFORM TO OWN

Login, hosting, backups and monitoring that Power Apps gave you

Build them once, on the engine every app shares

REVIEW LOAD AND SPRAWL

Every change needs an engineer, and cheap changes invite more of them

One owner who can say no. Rules ship off, and come out when they stop earning their place

WHY BUILD

- Internal tools become part of the product: same engine, same review, same owner
- The ten new apps reuse the roles, rules and audit log the first three already have

WHERE DEVIN FITS

If you build: Devin writes the changes. Your engineers review and merge them.

If you stay on Power Apps: Devin can still build custom connectors and write tests and documentation.

A pilot on one app, with your data

Refunds and KYC on your real merchants and cases, run alongside Power Apps before anything switches over.
