

Power Apps is five products in one

Licensed per user or per app, at about \$250K a year today. Leaving Power Apps means owning all five. Each part of this demo replaces one of them, in code your team owns.

POWER APPS GIVES YOU	WHAT IT DOES	IN THIS CONSOLE	WHERE YOU'LL SEE IT
App builder	Canvas or model-driven screens and forms, in the browser and on mobile	Each app is a declared tool on one shared shell	The three live apps; Part 3
Dataverse	Relational tables, with row- and column-level security	Tables per app, a role check on every action, masked personal data	Throughout
Connectors	Links to outside systems; many are premium, licensed per user	Code that calls the outside service, with the key kept on the server	Part 2
Power Automate	Workflows: approvals, alerts, scheduled jobs	Rules and approvals on one governed write path	Part 1
Admin plane	Environments, data policies, who can do what	Roles, live rule settings and one audit log	Part 1

Your team asks, Devin builds, an engineer approves

Today a rule on money is either fast and unreviewed, or reviewed after a two-week queue. This is a third way, shown three times.

Three times today, each change bigger than the last

Every step writes a row to one audit log.

Human gate Devin Live

You still pay engineers: to review, not to trace

	POWER APPS TODAY	OWNED CODE, ENGINEERS ONLY	OWNED CODE, WITH DEVIN
New rule, reviewed and merged	~30 minutes to live, never reviewed	1–2 weeks, then 4–6 engineer-hours	Same day: Devin's run, then minutes of review
Who checks it	Nobody	An engineer, 30–60 minutes	An engineer, against a plan committed before the first edit
Stop a misfire	Another live edit	A hotfix	One admin setting, in seconds
Clean up six months on	Nobody owns it	When a ticket gets prioritised	A reviewed removal pull request
Automate a manual step	A premium connector per user, or nothing	A ticket and a sprint	Same day, reviewed like any other change
Next app	Licences, and its own controls	Weeks	A first pull request, then small requests; seven controls inherited on day one

The first two columns are estimates. The last is what the demo showed, on seeded data with one reviewer.

Build the governed core with Devin, in stages. Retire Power Apps app by app.

REPLICABLE WITH DEVIN

- **Apps** on one shared engine: three live, Chargebacks started from its export
- **Rules and approvals** with maker-checker: added, switched off and removed
- **Connectors** written from public API docs, tested on recorded responses
- **Admin plane:** roles, live settings, masked data and one audit log across apps

NOT REPLICABLE, OR NOT SHOWN

- **Self-service:** business users no longer build alone; every change needs an engineer
- **The platform:** SSO, hosting, deploy pipeline, backups and on-call are not built yet
- **Microsoft 365 reach:** Teams, Outlook, SharePoint and mobile each become code you own
- **Accountability:** engine design and security sign-off stay with named engineers

WHERE THE RISK LIES

- **Migration tail:** undocumented formulas that behave differently on money
- **Review at volume:** a five-minute review is only as good as the tests and the reviewer
- **Cost is unproven:** licences go; engineers, hosting and Devin usage arrive
- **Thin evidence:** one demo, seeded data and test APIs, not production load

RECOMMENDATION

Build, behind a 90-day gate

The pain is rules on money that change often, span apps and need review. Owned code does that well; Power Apps doesn't.

1. **Weeks 0–4:** name an engine owner and a second reviewer. Decide SSO, hosting, database and deploys.
2. **Weeks 4–12:** finish Chargebacks. Run it alongside the Power App and compare every decision.
3. **Day 90 gate:** parity, review time, no unreviewed change, cost per change. Pass, then move apps by risk and licence cost.

Where Devin fits if you build

- Builds the platform pieces your engineers decide: SSO, deploys, database
- Moves each app: a first pull request, then small requests from its list
- Makes every later rule, check and removal, reviewed like today
- Never approves, never merges alone, never owns the engine

If you buy: stay on Power Apps, or move to another platform

- Add governance: managed environments, solutions in source control, approval pipelines
- Devin's role is smaller: custom connectors such as Companies House, and tests and docs for flows
- The review gap remains wherever the platform still allows live edits
