

Power Apps is five products in one

It costs about \$250K a year. If you leave, you have to replace all five.

POWER APPS	WHAT REPLACES IT	SHOWN IN
App builder	Each app is a page in the console	Part 3
Dataverse	Each app's data, with access set by role	Throughout
Connectors	Code that talks to outside systems directly	Part 2
Power Automate	Rules and approvals, all in one place	Part 1
Admin plane	Roles, settings you can change live, and a full audit log	Part 1

Your team asks, Devin builds, an engineer approves

Changes go live the same day, and an engineer still checks every one.

What this demo covers

 A person  Devin  Live

Engineers still check every change. They just don't write it.

	POWER APPS TODAY	YOUR ENGINEERS	YOUR ENGINEERS + DEVIN
Adding a rule	About 30 minutes, no one checks it	1–2 weeks	Same day, checked by an engineer
Turning a rule off	Edit it live	Ship a fix	Flip a switch in settings
Removing a rule	Rarely happens	Waits for a ticket	Devin removes it and an engineer checks
Adding an app	More licences	Weeks of work	One pull request to start, security built in

Build it yourselves, one app at a time, with one engineer in charge

WHAT THE DEMO PROVES

Rules can be added, turned off and removed, and an engineer checks each change

A manual check can be replaced with an automatic one

New apps get the same security from day one

WHAT IT DOESN'T PROVE

Login, hosting, backups and support aren't built yet

Business users can't make changes themselves any more

It hasn't run on real data or at real volume

RISKS

Undocumented Power Apps formulas may work differently once moved

Reviews can get rushed as the number of changes grows

Engineering and hosting costs could cancel out the licence savings

NEXT 90 DAYS

1. Pick one engineer to own the system, and a second to review
2. Move Chargebacks and run it alongside the Power App
3. Decide: does it match, how long do reviews take, what does each change cost?

WHERE DEVIN FITS

If you build: Devin writes the changes. Your engineers review and approve them.

If you stay on Power Apps: Devin can still build custom connectors and write tests and documentation.
